Induction Heater Working Principle. The principle on which induction heating works is very simple to understand. A magnetic field of high frequency is produced by the coil present in the induction heater and thus in turn eddy currents are induced over the metal (magnetic) object which is present in the middle of the coil and heats it.

Together with Holtek's touch IC, the induction cookers show performance more excellent under extreme noisy environments. To assist users with their rapid product design, Holtek has provided a block diagram, application circuits, PCB layout, component list as well as the MCU complete program code and other technical information.

#### Application Guides - Holtek

Induction cooktops may at times need separate circuits because they use large amounts of power. Induction cooktops need a 240-volt circuit protected with 40 or 50 current unit breakers direct. The best site of the junction base can be determined by whether the power cable that supplies the comes from the left or right of the house.

#### Do Induction Hobs Need Special Wiring?

Induction cooking is performed using direct induction heating of cooking vessels, rather than relying on indirect radiation, convection, or thermal conduction.Induction cooking allows high power and very rapid increases in temperature to be achieved, and changes in heat settings are instantaneous.
