Composite Laminates

The design of the layup for strength and weight (utilizing a finite element method for the stress analysis) is based on the Hybrid Algorithm for Laminate Optimization, modified to result in plates in which preassigned regions are of uniform thickness. The design of the layup for ease of manufacture is based on rules.

By using Puck criteria, matrix compression damage evolves from the top to the bottom of laminate and most of damage appears at several top plies. By comparison, matrix compression damage predicted using Hashin and Chang-Chang criteria is more severe than that using Puck criteria for several top plies.

Progressive Analysis of Bearing Failure in Pin-Loaded Composite Laminates Using an Elasto-Plastic Damage Model. Bearing failure of composite laminate is very complicated due to the complexity of different failure mechanisms and their interactions. In this paper, an elasto-plastic damage model is built up to describe the process of failure in composite laminates subjected to bearing load.
